

# Lab 4: AWS Security and Server Infrastructure

A demo of the basic setup of this lab is at: <https://youtu.be/GaMd8MaqBXA>

## A Outline

In previous labs we have set up a range of architectures with vSphere. This is a private cloud environment and creates infrastructure as a service. Increasingly we use the public cloud to build our information systems, and which reduces the investment in data centre costs, while providing the opportunity to quickly scale our server, network and data infrastructure. It is generally as pay-as-you-go model, and where we pay for CPU time, network bandwidth and data costs. The most popular cloud provider is AWS (Amazon Web Services), and which provides EC2 (for compute), S3 (for data buckets), RDS (for databases) and AWS Network Firewall (for firewalls). Some of these services are outlined in Figure 1.

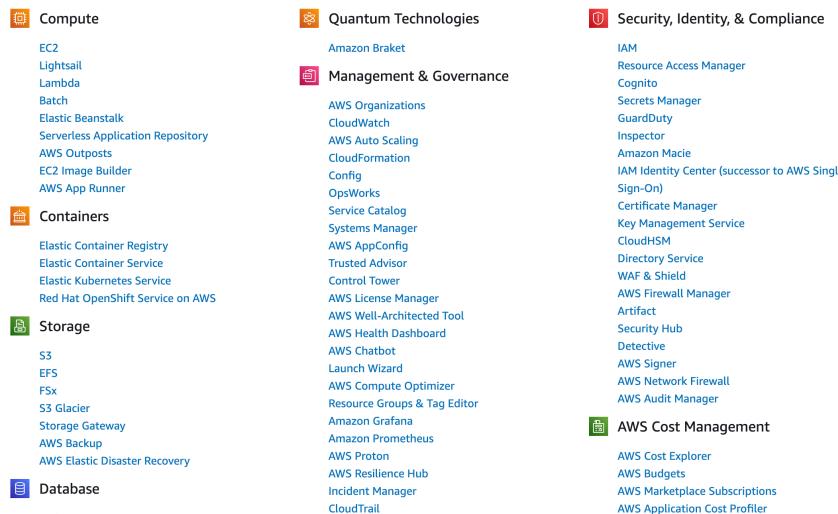

Figure 1: AWS Services

## B Enabling your lab

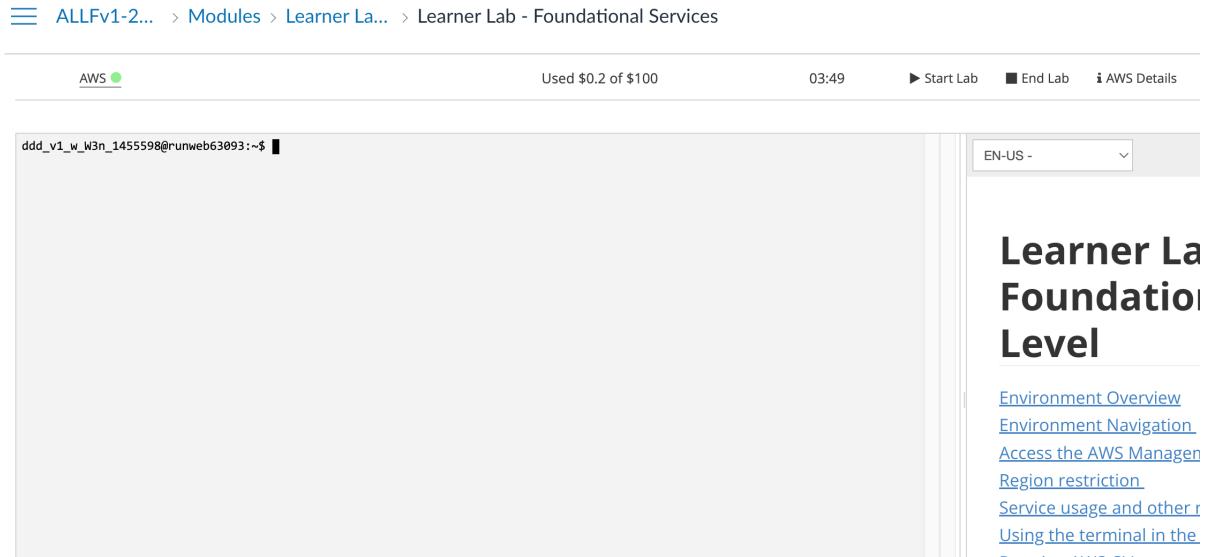

You should have an AWS Academy login, so go to: <https://awsacademy.instructure.com/> and log into the system, and select **AWS Academy Learner Lab** (Figure 2).

AWS Academy Learner Lab - Foundation Services [28224]

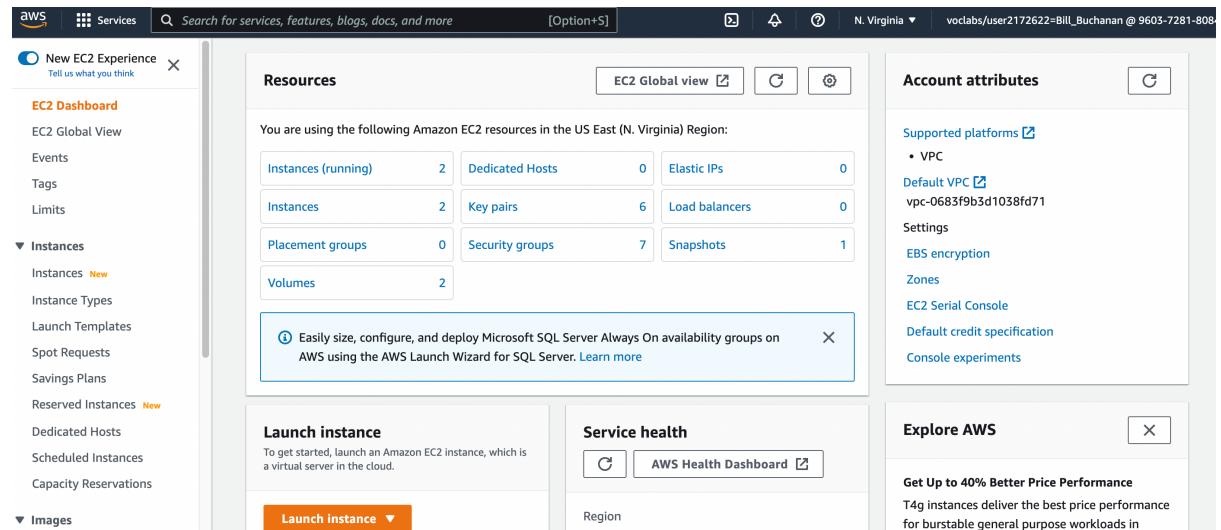

Figure 2: AWS Academy Learner Lab

Next, select “Modules”, and then “Learner Lab - Foundational Services”, and should have the lab environment (Figure 3).

**Figure 3:** AWS Academy Learner Lab environment

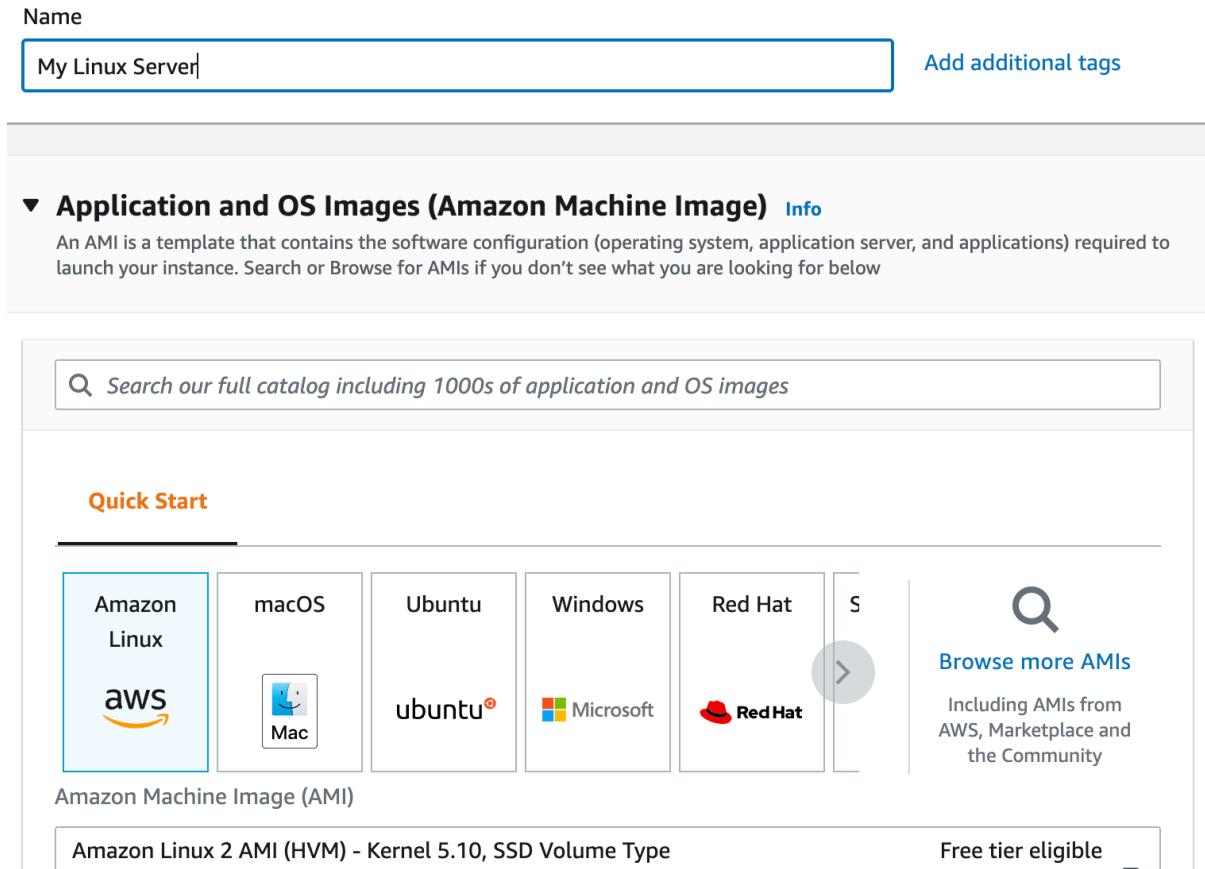

In the console you can interact with your AWS though the console. Now, press the “Start Lab” button, and wait for the AWS light to go green. Once, green, you can click on it, and open up your AWS Management console. After this just select EC2, and you should see your EC2 environment.

**Figure 4:** AWS Management Console

## C Creating and Securing a Linux Server

We will now create a Linux Server, and which should be accessible from the Internet. For this select “Launch Instance”, and then give it a name (such as “My Linux Server”) and select the Amazon Linux instance for the AMI (Amazon Machine Instance) – as shown in Figure 5.

**Figure 5:** Creating Amazon Linux instance

Now select **t2.micro** for the instance type.

How many vCPUs will the instance have?

How much memory will it have?

How much will it cost per day to run?

If you selected, t2.medium, how much would it cost per day?

If you selected, t2.large, how much would it cost per day?

Now create a new key pair and save it to your local drive. This file contains your private key, and which you will need to connect to your instance. Accept all the other defaults.

Observe the firewall group that will be applied.

Which firewall ports are open on the instance?

What is the main issue with this firewall setting?

How would you change it, once you have created the instance?

Observe the disk storage setting for the instance.

What type of disk will be used? [HDD/SSD]

What is the advantage of using SSD?

For disk storage, what is the size of the disk that you will create?

What is the maximum storage size for a free tier storage of the AMI instance we are creating?

### C.1 Creating the instance

Go ahead and create the instance. Go back to the Management Console, and find your instance. Wait for it to set its state to running. Now we will connect to it. For this we need to create an SSH connection, and use the private key we have generated. The public key will be stored on the instance, and will authenticate our access. We do not need a username or password to access the instance, as this is often insecure. Our PEM file will give us access.

Now, we will examine the details of our instance (Figure 6). On the instance summary, determine the following:

The public IP address:

The private IP address:

The instance type:

The public IPv4 DNS:

From your local host, can you ping the public IP address? [Yes/No]

Why can't you successfully ping your instance?

Which region of the world is your instance running in?

### C.2 Enabling ICMP on firewall

Now we will enable ICMP on the instance. First click on the Security tab of the instance summary, and then on the security group.

What is the firewall rule that is applied to the instance?

[SSH/Telnet/FTP/HTTP/HTTPs] for [0.0.0.0/0 or 0.0.0.0/8 or 0.0.0.0/16 or 0.0.0.0/32]

What does 0.0.0.0/0 represent?

Now go ahead and add an ICMP rule for all hosts (Figure 7).

Can you now successfully ping your instance? [Yes/No]

Now, lock your ICMP rule down to just your IP address (you need to use a /32 address for this). Can you still successfully ping the instance? [Yes/No]

Ask your neighbour or one of the lab tutors to ping your instance. Can they successfully ping it? [Yes/No]

What is the advantage of putting the firewall in AWS, rather than in the instance?

EC2 > Instances > i-07b0512e24e263766

Instance summary for i-07b0512e24e263766 (MyLinuxServer) [Info](#)

Updated less than a minute ago

Instance ID	Public IPv4 address	Private IPv4 addresses
i-07b0512e24e263766 (MyLinuxServer)	52.90.3.121   <a href="#">open address</a>	172.31.16.186
IPv6 address	Instance state	Public IPv4 DNS
-	Pending	ec2-52-90-3-121.compute-1.amazonaws.com   <a href="#">open address</a>
Hostname type	Private IP DNS name (IPv4 only)	Elastic IP addresses
IP name: ip-172-31-16-186.ec2.internal	ip-172-31-16-186.ec2.internal	-
Answer private resource DNS name	Instance type	AWS Compute Optimizer finding
IPv4 (A)	t2.micro	<a href="#">Opt-in to AWS Compute Optimizer for recommendations.</a>
Auto-assigned IP address	VPC ID	<a href="#">Learn more</a>
52.90.3.121 [Public IP]	vpc-0683f9b3d1038fd71	
IAM Role	Subnet ID	Auto Scaling Group name
-	subnet-00bdb3e7927760f46	-

ⓘ You can now check network connectivity with Reachability Analyzer [Run Reachability Analyzer](#) X

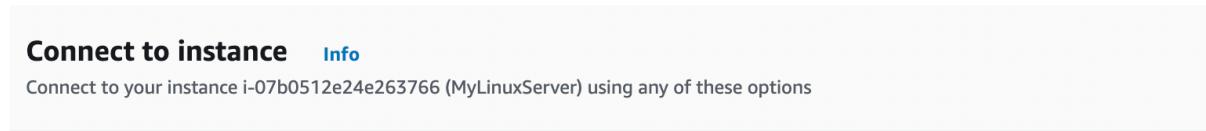

Inbound rules (2)

Name	Security group rule...	IP version	Type	Protocol	Port
-	sgr-0ed01ab1ba175fe5b	IPv4	SSH	TCP	22
-	sgr-04b533407d759a...	IPv4	All ICMP - IPv4	ICMP	All

Figure 7: Enable ICMP

### C.3 Accessing your instance

Now we will connect to our instance. For this you need SSH. This may be installed on the host you are using (such as in vSoC 2), or from Apps Anywhere. Once you have SSH, press Connect on your instance summary, and you should have tabs for Connect to instance (Figure 8). Next select the SSH client tab, and you will see the details of connecting to your instance with SSH.

Instance ID

[i-07b0512e24e263766 \(MyLinuxServer\)](#)

1. Open an SSH client.
2. Locate your private key file. The key used to launch this instance is mynewkeypair.pem
3. Run this command, if necessary, to ensure your key is not publicly viewable.  
 `chmod 400 mynewkeypair.pem`
4. Connect to your instance using its Public DNS:  
 `ec2-52-90-3-121.compute-1.amazonaws.com`

Example:

`ssh -i "mynewkeypair.pem" ec2-user@ec2-52-90-3-121.compute-1.amazonaws.com`

**Figure 8:** Connect to instance

Now find your PEM file, and protect it with:

`chmod myfile.pem`

What protection does this put on your private key?

Next use the SSH connect with the name of your PEM file and with the DNS (or IP address) for your instance. For example, in the case in Figure 8, we have:

`ssh -i "mynewkeypair.pem" ec2-user@ec2-52-90-3-121.compute-1.amazonaws.com`

What is the name of the user that logs in?

An example of connecting is:

```
% ssh -i "mynewkeypair.pem" ec2-user@ec2-52-90-3-121.compute-1.amazonaws.com
The authenticity of host 'ec2-52-90-3-121.compute-1.amazonaws.com (52.90.3.121)' can't be established.
ED25519 key fingerprint is SHA256:/c5UOK6gprKL19XCptNQ1brb9MpYR5wEeqhd/6t+/wk.
This host key is known by the following other names/addresses:
  ~/.ssh/known_hosts:48: ec2-3-90-189-201.compute-1.amazonaws.com
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes
Warning: Permanently added 'ec2-52-90-3-121.compute-1.amazonaws.com' (ED25519) to the list of known hosts.
Last login: Fri Sep 30 17:07:00 2022 from ec2-18-206-107-27.compute-1.amazonaws.com
```

```
__| | C | - / Amazon Linux 2 AMI  
__| \__| __|  
https://aws.amazon.com/amazon-linux-2/  
[ec2-user@ip-172-31-16-186 ~]$
```

Have you managed to connect? [Yes/No]

Is there a folder named .ssh? [Yes/No]

What is the purpose of the file contained in .ssh?

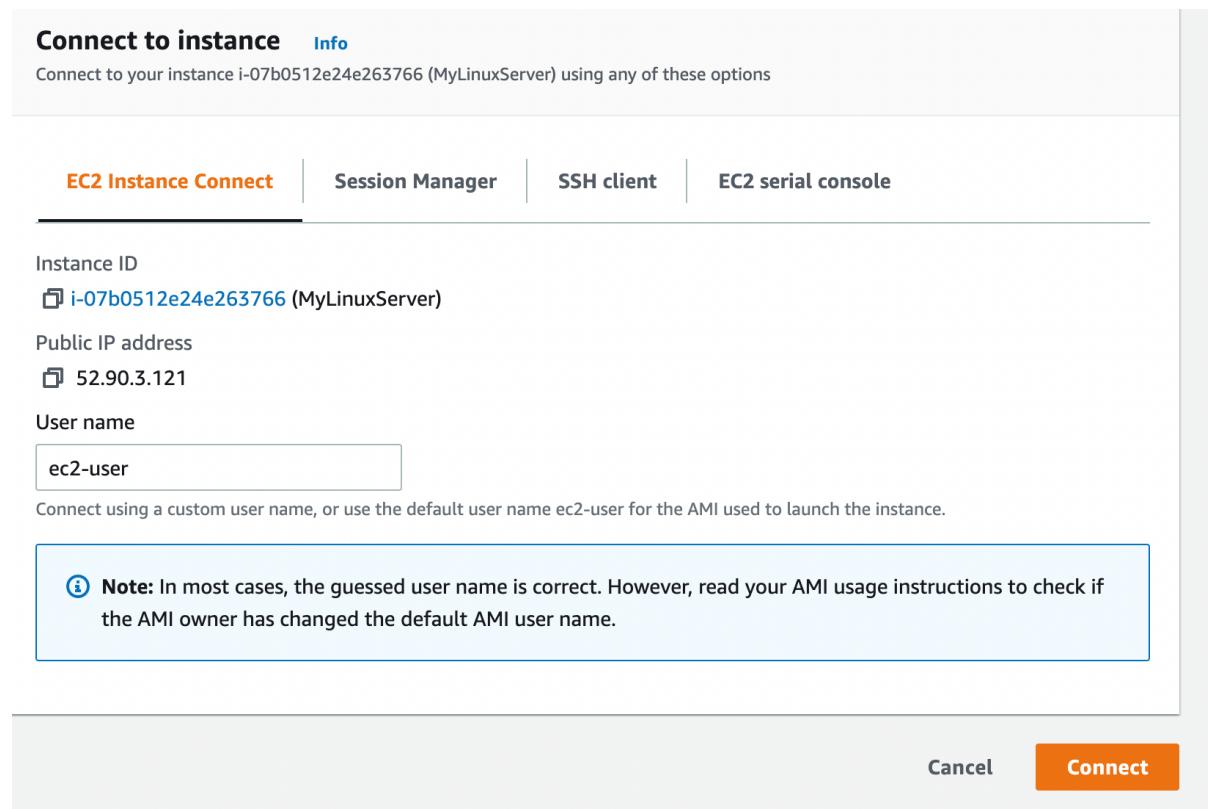

By using “ip addr show” or “ifconfig” in your instance, what is the private IP address of it?

Can you ping 8.8.8.8 from your instance? [Yes/No]

Now create a folder in the top level named “mytestfolder”, and put a new file in there named “mytext.txt”.

Now go to the EC2 Instance Connect, and press on the Connect button. You should now get a console terminal in the browser (Figure 9).

Verify that your file has been created. Has it been created in the instance? [Yes/No]

**Figure 8:** EC2 Instance Connect

```
Last login: Sun Oct  2 11:39:05 2022 from host86-131-160-187.range86-131.btcentralplus.com
[ec2-user@ip-172-31-16-186 ~]$ cd mytestfolder/
[ec2-user@ip-172-31-16-186 mytestfolder]$ ls
mytext.txt
[ec2-user@ip-172-31-16-186 mytestfolder]$ cat mytext.txt
Test
[ec2-user@ip-172-31-16-186 mytestfolder]$
```

**Figure 9:** EC2 Instance Connect terminal

Now examine the running services on the instance with:

```
$ netstat -i | grep tcp
$ netstat -i | grep udp
```

Which of the main services are running:

#### C.4 Installing a Web server

Now we will install a Web server on the instance with:

```
sudo yum update -y
sudo yum install -y httpd.x86_64
sudo systemctl start httpd.service
sudo systemctl enable httpd.service
```

Next open up a browser on your host and access your instance for Web access.

Can you connect to it? [Yes/No]

Why can't you connect to it?

Now enable a firewall rule on Port 80 and Port 443, and allow access (see Figure 10).

Inbound rules <a href="#">Info</a>								
Security group rule ID	Type <a href="#">Info</a>	Protocol <a href="#">Info</a>	Port range <a href="#">Info</a>	Source <a href="#">Info</a>	Description - optional <a href="#">Info</a>			
sgr-0ed01ab1ba175fe5b	SSH	TCP	22	Custom ▾	<input type="text" value="0.0.0.0/0"/> <a href="#">X</a>	All access to Web server	<a href="#">Delete</a>	
sgr-04b533407d759a286	All ICMP - IPv4	ICMP	All	Anywh... ▾	<input type="text" value="0.0.0.0/0"/> <a href="#">X</a>	Ping	<a href="#">Delete</a>	
-	HTTPS	TCP	443	Anywh... ▾	<input type="text" value="0.0.0.0/0"/> <a href="#">X</a>	All access to Web server	<a href="#">Delete</a>	
-	HTTP	TCP	80	Anywh... ▾	<input type="text" value="0.0.0.0/0"/> <a href="#">X</a>	All access to Web server	<a href="#">Delete</a>	

**Figure 10:** Enable HTTP and HTTPS rules

Can you now connect to your Web site? [Yes/No] (see Figure 11)

The screenshot shows a web browser window with the address bar displaying 'Not Secure | 52.90.3.121'. The main content area has a red header bar with the text 'Test Page'. Below the header, there is a message: 'This page is used to test the proper operation of the Apache HTTP server after it has been installed. If you can read this page, it means that the Apache HTTP server installed at this site is working properly.' There are two sections of text: 'If you are a member of the general public:' and 'If you are the website administrator:'. Both sections provide instructions for troubleshooting and adding content to the server. At the bottom right, there is a 'Powered by APACHE 2.4' logo.

**Figure 11:** Sample access to Web site

Now go into the /var/www folder, and create a file named “index.html”, and add:

```
<h1>Main web site</h1>
<p>Hello to you</p>
```

And then save the file.

Has it changed the welcome? [Yes/No]

## C.6 Auditing

The main logging output is in the /var/log folder. Identify the contents of the following files:

What are the likely contents of the “secure” file?

What are the likely contents of the “boot.log” file?

List the log/httpd/access\_log file. What are its contents? Can you identify your browser access? (see Figure 12). Which browser type accessed your Web server?

Now try with another browser type, and re-examine the log/httpd/access\_log file. Did it detect the new browser type?

Now access a file that does not exist in your site (such as http://AWSIP/test.htm). Now re-examine the log/httpd/access\_log file. What is the status code returned for the access?

```

```

**Figure 12:** Sample list of log/httpd/access\_log

## C.7 Accessing from AWS prompt

We can also access our instance from the AWS prompt. For this return to your AWS Academy console, and enter the command (Figure 12):

```
$ aws ec2 describe-instances
```

From the results, can you identify:

Instance type:

Public IP address:

Private IP address:

State:

```

ddd_v1_w_W3n_1455598@runweb63093:~$ aws ec2 describe-instances
{
    "Reservations": [
        {
            "Groups": [],
            "Instances": [
                {
                    "AmiLaunchIndex": 0,
                    "ImageId": "ami-026b57f3c383c2ec",
                    "InstanceId": "i-07b0512e24e263766",
                    "InstanceType": "t2.micro",
                    "KeyName": "mynewkeypair",
                    "LaunchTime": "2022-10-02T11:14:16+00:00",
                    "Monitoring": {
                        "State": "disabled"
                    },
                    "Placement": {
                        "AvailabilityZone": "us-east-1b",
                        "GroupName": "",
                        "Tenancy": "default"
                    },
                    "PrivateDnsName": "ip-172-31-16-186.ec2.internal",
                    "PrivateIpAddress": "172.31.16.186",
                    "ProductCodes": [],
                    "PublicDnsName": "ec2-52-90-3-121.compute-1.amazonaws.com",
                    "PublicIpAddress": "52.90.3.121",
                    "State": {
                        "Code": 16,
                        "Name": "running"
                    },
                    "StateTransitionReason": "",
                    "SubnetId": "subnet-00bdb2e7927760f46",
                    "VpcId": "vpc-0683f9b3d1038fd71",
                    "Architecture": "x86_64"
                }
            ]
        }
    ]
}

```

**Figure 13:** Accessing instances

Now try we will stop our instance using an AWS EC2 command. Run the following with your instance ID (see Figure 14):

```
aws ec2 stop-instances --instance-ids [My-instance-ID]
```

From the AWS Management Console, has your instance stopped? [Yes/No]

```

ddd_v1_w_W3n_1455598@runweb62964:~$ aws ec2 stop-instances --instance-ids i-07b0512e24e263766
{
    "StoppingInstances": [
        {
            "CurrentState": {
                "Code": 64,
                "Name": "stopping"
            },
            "InstanceId": "i-07b0512e24e263766",
            "PreviousState": {
                "Code": 16,
                "Name": "running"
            }
        }
    ]
}
ddd_v1_w_W3n_1455598@runweb62964:~$ █

```

**Figure 14:** Stopping an instance

Now we will restart the instance, with:

```
aws ec2 start-instances --instance-ids [My-instance-ID]
```

Has the instance re-started? [Yes/No]

Now we will change the instance type from t3.micro to t3.small. To do this, run the following commands:

```
aws ec2 stop-instances --instance-ids [My-instance-ID]
aws ec2 wait instance-stopped --instance-ids [My-instance-ID]
aws ec2 modify-instance-attribute --instance-id [My-instance-ID] --instance-type "{\"Value\": \"t3.small\"}"
aws ec2 start-instances --instance-ids [My-instance-ID]
```

Did it change the instance type? [Yes/No]

Can you still get access to your instance?

By observing the script, and investigating what t3.micro and t3.small are, can you determine what has changed about your instance?
